### COVID-19 (Corona) Virus

#### Qualitative Polymerase Chain Reaction (PCR)

**Specimen** Swab

**Result** Not Detected

One or more negative results do not rule out the possibility of COVID-19 virus infection. A number of factors could lead to a negative result in an infected individual, including:

- poor quality of the specimen, containing little patient material
- the specimen was collected late or very early in the infection
- technical reasons inherent in the test, e.g. virus mutation or PCR inhibition.

If a negative result is obtained from a patient with a high index of suspicion for COVID-19 virus infection, particularly when only upper respiratory tract specimens were collected, additional specimens, including from the lower respiratory tract if possible, should be collected and tested.

If your test result is Detected, you are advised to stay in isolation to prevent the spread of the virus. Home isolation guidelines can be found at [www.chughtailab.com/coronavirus](http://www.chughtailab.com/coronavirus).

For travel purposes, we recommend that you wait 14 days before getting a repeat test.

Test performed using TaqMan 2019 nCoV Assay Kit v2 by Thermo Fisher Scientific.
